OVERVIEW : SAMVERA

Samvera is a software product launched in 2009 by a joint collaboration between Stanford University, the University of Hull, the University of Virginia and Fedora Commons.

It is designed to be an open-source digital repository software to allow access to all users. The main components of Samvera are Fedora Commons, Blacklight. Solr, and Hydrahead.

Samvera is a tremendous application in libraries and digital repositories. It allows all kinds of digital files to be stored for digital archiving and ease of access.

WHAT IS SAMVERA

- Samvera is an Icelandic word meaning “togetherness.” The Samvera Community is a global community of technologists who create and maintain repository software; you can’t install Samvera, but you can install the repository solutions we develop together including Avalon Media System, Hyrax, and Hyku. Institutions around the world rely on Samvera Community supported software to provide access to their digital content. .

WHAT IS SAMVERA

- Samvera is also a community of practice where software developers and library technologists can support and learn from one another. We have active participation from metadata specialists, repository managers, user experience professionals, and others who contribute their expertise to ensure the software stays relevant and responsive to changing needs.

WHAT IS SAMVERA

- Samvera software is free and open source, available under an Apache 2 license, and is based around four major components:
- The Fedora repository software- providing a robust, durable repository layer for persisting and managing digital objects.
- Solr indexes- providing fast access to information about an institution's repository content.
- Blacklight- a Ruby on Rails plugin that sits above Solr and provides faceted searching, browsing and tailored views on objects.
- Samvera gems- Ruby on Rails components that integrate the building blocks to form a complete, flexible and extensible digital repository solution.

WHAT IS SAMVERA

These components may be used by institutions to develop their own completely customized local solutions but are also used in three major community-supported applications, or “solution bundles”:

- Avalon – a time-based media solution
- Hyrax – a Ruby gem that includes much of Samvera’s functionality. It is the basis on which users can build their own, customized version of Samvera.
- Hyku – a feature-rich, robust, flexible, multi-tenant digital repository that is easy to install, configure, and maintain. Hyku can be installed locally or run in the cloud and is based on
- Hyrax- A number of service providers are or will soon be an offering cloud-based, hosted versions.
